My O2 App Account Navigation

Simplified account navigation, reducing product re-selection from 6 steps to 3 in the redesigned journey.

Role

- Product design
- Customer experience strategy

Team

- Billing
- Backend engineering
- Fontline retail
- Product owners

Timeline

4 months, homepage design and CRO testing ongoing

Platform

My O2 App (iOS and Android)

01 Challenge

Customers faced unnecessary friction when switching between products and accounts. My role was to design a more intuitive, product-led navigation experience while working within the existing account and billing structure.

02 Constraints

Design had to work within the existing account and billing structure. Different rules applied to finance agreements, companion devices and SIM Free Finance so there wasn't a single product hierarchy.

03 Finding the friction

Four inputs → one IA

Existing app and customer behaviour: Multiple accounts, multi-line switching, confusing account/product relationships. Customer testing also showed people going directly to Account looking for detailed usage, while extras were described as confusing.

Web and existing design patterns: Current O2 web billing, itemised billing and existing multi-MSISDN patterns.

Backend and billing rules: Billing-account level data, Netcracker rules, CCA/finance agreements, SIM only/standard plans and companion-device relationships

API edge cases: Unavailable account names, closed accounts, incomplete adjustment-charge taxonomy and data-return limitations.

Research

Discovery sessions with billing, backend engineering, frontline retail and product owners to understand how accounts, products and billing fit together.

Key insight

The app had no shared map of its own logic so customers were being asked to navigate rules nobody had written down.

04 Exploring options

I explored fully product-led and flattened structures to reduce the emphasis on billing accounts. However, the billing investigation showed that products don't consistently map 1:1 to accounts and billing itself is returned at account level.

I therefore kept the account as the billing foundation while making product-level interactions more prominent. This gave customers a simpler experience without breaking the underlying billing logic.

The goal wasn't to remove the account model. It was to stop exposing its complexity when customers didn't need it.

05 The design

Accounts to Products

Redesigned around the product the customer is managing, with billing kept at account level. This matches the product-led web experiences and reduces account switching.

Simpler product view

Replaced the carousel with a static product view, removing unnecessary hierarchy and headings so the active product and key actions were easier to find.

No re-selection

Actions like Buy Bolt-On keep the selected product and go straight to the relevant journey.

06 Outcome and next steps

The redesigned tariff-change and Bolt-On journeys reduced product re-selection from 6 steps to 3. Next, CRO testing will measure the impact on drop-off and identify any remaining friction.
