Product Card Research

Research and testing behind a 21% uplift in XSUS orders.

Role

- Product design
- User research and experimentation
- CRO test and acceptance criteria documentation

Team

- CRO
- Engineering
- QA Analyst

Timeline

4 months; CRO testing ongoing for non-TV product cards

Platform

Virgin Media existing customer store (Desktop and Mobile)

01 Challenge

TV add-on cards created heavy scrolling and made products difficult to compare. My role was to use research to create a clearer product-card experience and structure the CRO test so we could understand which changes improved performance.

02 Constraints

Eligibility, holdings and dependencies meant cards had to handle available, unavailable, selected and error states.

03 Understanding existing behavioural data and user research

Almost 40% of customers weren't opening the product accordions, meaning many never saw the available products.

Research showed customers thought about **channels before packages**, helping identify an opportunity to improve how TV options were structured and compared.

Contentsquare data showed an average 20% exit rate over 90 days, while research highlighted heavy scrolling and difficulty comparing offers.

Existing selection controls also created interaction limitations, while the **cards needed to accommodate eligibility states, bundles and regulatory messaging** such as the 14-day cancellation copy.

The challenge wasn't simply redesigning the cards. It was helping customers discover, compare and select products more easily.

04 Exploring and validating multiple interaction models

I explored carousel, card and CTA variations to reduce scrolling and make TV products easier to browse and compare. I tested multiple concepts with customers, using discoverability, comparison and CTA clarity to evaluate them.

7 of 10 participants preferred Variant Y, helping narrow the direction before progressing to CRO experimentation. Customers preferred larger cards and clearer CTAs, even with slightly more scrolling, and wanted to see which channels were included rather than only a channel count.

05 The design

Simpler hierarchy
Made the product, value and action clear at a glance.

Designed for real states
Designed around holding, eligibility and error states, then translated them into Gherkin acceptance criteria shared across design, engineering and QA.

Filter chips
Added filters to help customers narrow and compare.

06 Outcome and next steps

The filter-chip variant reached 95% statistical confidence, compared with 90% for the card-only variant, isolating filters as the additional change behind the stronger result.

Next, the pattern will be tested across non-TV product cards to see whether the same hierarchy, comparison and selection principles scale across the wider experience.
