Virgin Media Home Movers Journey

Used behavioural data and research to simplify the homepage and wider home-move journey.

Role

- Product design
- UX strategy
- User research

Team

- Product owners and manager
- CRO
- Developers
- UX researchers

Timeline

Research done in July 2026. Design and CRO iteration ongoing

Platform

Desktop and Mobile

01 Challenge

Only 45% of sessions progressed from the Movers homepage to postcode entry. Research also showed customers needed more reassurance around availability, connectivity and what would happen during their move. My role was to understand the friction and use those findings to redesign the homepage and wider home-move journey.

02 Constraints

The redesign had to balance customer needs with legal pricing requirements, legacy technology, different serviceability routes and fragmented journey ownership.

Faster broadband could be surfaced, but upgrades couldn't happen within the move itself so I needed to provide reassurance and communicate the opportunity without pulling customers away from completing their move.

03 Analysing where and why customers were dropping out

Data used
Contentsquare behavioural data and Tableau funnel data.

Research
July 2026 user research into what customers needed before starting a move.

Key insight
The homepage felt lengthy and static, while customers needed more reassurance before committing. Only 15% of serviceable sessions went on to start the web booking journey.

04 Exploring beyond the existing journey

I explored different ways to simplify the Movers homepage without removing information customers needed to feel confident progressing. This included reordering the information hierarchy, introducing a carousel and simple motion, prioritising FAQs, and testing different ways to communicate faster broadband availability.

The options were shaped by the constraint that customers could explore upgrades but couldn't complete one within the move journey, helping balance reassurance and commercial opportunity without adding another exit point.

> **Moving home is already complex. The experience didn't need to add to it.**

05 The design

Simpler hierarchy
Organised the homepage around customers' key questions and actions.

Simple motion design
Made key moments more engaging and broke up the page.

06 Validating the evidence

I tested three notification treatments to understand how clearly customers noticed and understood the faster-speed opportunity.

94% preferred one of the two prominent treatments, helping refine the final direction around stronger visibility and clearer reassurance that upgrades happen after the move.

07 What that evidence changed

The research established a clearer direction for communicating faster broadband without interrupting the core move journey. The refined experience is now ready for CRO testing, where messaging such as "faster speeds" vs "4x faster" can be measured against progression and drop-off rather than stated preference alone.
