VMO2 App Library Design System

___Challenge

Similar components were being recreated across brands, creating inconsistencies between design and development.

Teams were recreating similar components across brands, creating inconsistent states and design-to-development drift. My role was to help shape a scalable cross-brand system, then put it into practice by creating the My O2 App master file and implementing the new variable structure.

___Outcome

Made theme application ~93% faster, reducing it from 54+ seconds to under 4 seconds and saving an estimated 5–6 hours per designer each year.

___Scope

Design systems

Component strategy

UX implementation

FINDING THE INCONSISTENCIES

Audited the existing system

I helped audit repeated patterns and inconsistent component states across the apps, identifying where components could be consolidated into shared foundations.

BUILDING SCALABLE FOUNDATIONS

Rebuilt components with Figma Variables

I helped rebuild components from atomic foundations using Figma Variables, replacing the slower Tokens Studio workflow with native theming and reducing reliance on third-party tooling.

CLOSING THE DESIGN-TO-CODE GAP

Aligned design with development

I worked with engineering so component and variable logic reflected how the UI was built, helping reduce gaps between Figma and implementation.

PUTTING THE SYSTEM INTO PRACTICE

Implemented the system in My O2 App

I created the My O2 App master file and was the first to implement the new Figma Variables into a live app design file. This proved the variable structure could work in practice and created a foundation for migrating components away from Tokens Studio.

FASTER BY DESIGN

~93% faster theme application

Moving to Figma Variables reduced theme application from 54+ seconds to under 4 seconds. Across 7,609 recorded component inserts, this was estimated to save 5–6 hours per designer each year while creating a more scalable cross-brand foundation.
