Product Card Research

___Challenge

Customers needed to compare TV products while navigating complex eligibility, holdings and product dependencies.

TV add-on cards created heavy scrolling and made products difficult to compare. My role was to use research to create a clearer product-card experience and structure the CRO test so we could understand which changes improved performance.

___Outcome

Redesigned TV product cards contributed to a reported 21% uplift in XSUS orders, with the winning variant reaching 95% statistical confidence.

___Scope

Product design

User research and experimentation

SIMPLIFYING THE CHOICE

Simplified the product cards

I simplified the information hierarchy to make the product, value and action easier to understand at a glance. Research showed customers preferred larger product cards and clearer CTAs, even when this meant slightly more scrolling.

DESIGNING FROM EVIDENCE

Used research to refine the design

I tested different approaches with 10 Virgin Media customers without TV. 7/10 preferred Variant Y, finding the CTA clearer and valuing the reassurance that products could easily be removed from their basket.
Wider research also showed customers wanted clearer product comparisons, including which channels were included rather than channel count alone.

HANDLING REAL-WORLD COMPLEXITY

Designed for real customer states

I co-designed the experience around different holding and eligibility states, including available, unavailable, selected and error scenarios.
I translated these into Gherkin acceptance criteria so design, engineering and QA shared the same expected behaviour.

TESTING WHAT WORKED

Isolated the winning design change

I worked with CRO to test redesigned cards alone (V1) against redesigned cards with filter chips (V2). I kept the explored carousel out of the experiment to avoid introducing another variable.

A CLEARER CHOICE THAN CONVERTED

21% uplift in XSUS orders

The filter-chip variant reached 95% statistical confidence, compared with 90% for the card-only variant. This helped isolate the filters as the additional change behind the stronger result and gave the team a pattern to test on other product cards.
