Virgin Media Home Movers Journey

___Challenge

Only 45% of sessions progressed from the Movers homepage to postcode entry.

Only 45% of sessions progressed from the Movers homepage to postcode entry. Research also showed customers needed more reassurance around availability, connectivity and what would happen during their move. My role was to understand the friction and use those findings to redesign the homepage and wider journey.

___Outcome

Redesigned the Movers homepage around behavioural data and customer research, targeting the 55% drop-off before postcode entry.

___Scope

Product design

UX strategy

User research

FINDING THE FRICTION

Analysed where customers were dropping out

I combined Contentsquare behavioural data, Tableau funnel data and 2026 user research to understand where customers were struggling and what they needed before starting their move.

DESIGNING FROM THE RESEARCH

Turned research into the homepage redesign

Research showed the homepage felt lengthy and static, so I simplified the content hierarchy around customers' main questions and actions. I also introduced simple motion design to make key moments more engaging and break up the experience.

LOOKING BEYOND THE HOMEPAGE

Redesigned the wider journey

I used the same evidence to review the wider serviceability and booking journey. Funnel analysis showed only 15% of serviceable sessions went on to start the web booking journey, highlighting another point of friction to address.

VALIDATING THE DIRECTION

Tested and refined key decisions

I ran further research to validate parts of the redesigned experience, including how faster broadband could be communicated without distracting customers from their move. 94% of 89 participants chose one of the two prominent green notification treatments, which informed the direction for further refinement.

AN EVIDENCE-LED DIRECTION

Redesigned around the 55% drop-off before postcode entry

Behavioural data, customer research and testing shaped the homepage and wider journey. The redesigned direction creates a clearer route through postcode entry, serviceability and booking, while keeping secondary messages focused on supporting the move.
